

AE&E Austria wins an order for a 162 MW top gas fired boiler

Austrian Energy & Environment AG & Co KG to supply another unit for voestalpine Stahl

On June 15, 2007, Austrian Energy & Environment AG & Co KG received an order from voestalpine STAHL GMBH for the supply, installation and start-up of one of the world's largest top/coke gas fired steam boilers. The new unit will be delivered complete with a DeNox unit, feed water system and piping. Following the supply of three existing units and a number of modernisation contracts, this major order has enabled AE&E to establish a long-term position as a key supplier to this important regular customer.

The boiler plant to be delivered by AE&E will use the waste gas generated during blast furnace and steelmaking operations (top gas, coke gas, etc.) energetically for steam and electricity generation. The new unit will have a power output of approximately 162 MW.

For the customer, this plant represents the best possible energetic use of waste gas and adherence to the strict Austrian emission regulations.

With this success AE&E has once again provided impressive evidence of its capabilities as a partner to the iron and steel industry.
